

Invoice Connect - Product Data Sheet

Overview

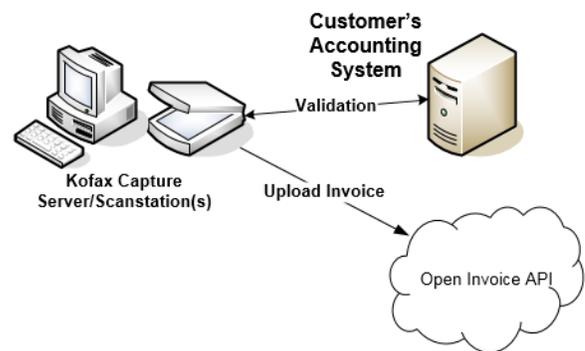

The Invoice Connect product suite from Concerta Consulting provides customers with a highly configurable and flexible solution for the variety of integration points between their financial accounting environment and Accounts Payable processes, and [OpenInvoice](#) (from Oildex).

The Invoice Connect suite provides the following general features:

- Highly configurable, using configuration file options and customer-specific database objects.
- Extensive logging for determining status of any specific "approved" transaction from OpenInvoice, including emailing and reporting of exceptions.
- Modular architecture, allowing easy extensibility for other Financial Accounting systems and Document Management systems.

Document Capture (Kofax Integration)

OpenInvoice solution will typically encompass anything from 60 to 80% of a customer's Accounts Payable transactions via direct entry (XML) transactions. The remainder will still be received by the customer, either in paper form or via email as an attachment. The purpose of the Invoice Connect Document Capture feature is to allow these paper invoices to follow the exact same approval process as those received via direct entry transactions.

Tightly integrated with the customer's Financial Accounting system (for purposes of looking up vendor details, checking for duplicate invoices etc), Document Capture uses the market-leading Kofax Capture product to scan invoices in to OpenInvoice. You can use existing scanning hardware, including MFPs, or use purpose-specific document scanners (Concerta Consulting is also an authorised Fujitsu reseller).

Once the invoices have been scanned (or imported from email), they are tagged with invoice header information, including vendor number, invoice number, invoice date and amount. This data is then automatically uploaded to OpenInvoice (via OpenImage) together with the scanned invoice (uploaded as a PDF).

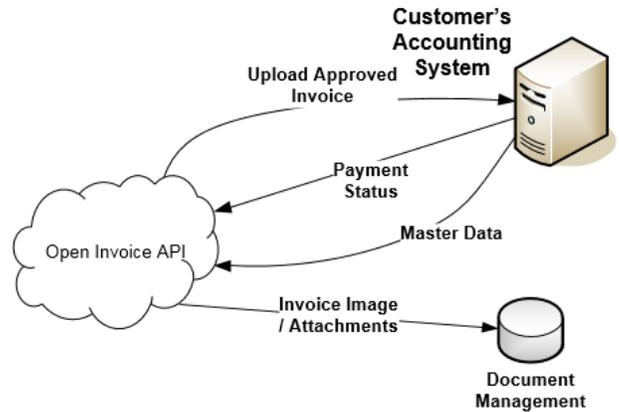

Financial Accounting Integration

There are a number of components to the integration between OpenInvoice and the customer's Financial Accounting System, as shown below:

Approved Invoice Upload

Once invoices are approved within OpenInvoice, they are available for upload to the customer's Financial Accounting system. Invoice Connect takes the approved invoice transactions, performs a variety of validations on the data, and then uploads them to the accounting system.

Invoice Connect currently supports P2's QByte accounting system, but the modular nature of Invoice Connect means that adding additional accounting systems is relatively straightforward.

Document Management

Invoice Connect can optionally be configured to capture the invoice documents from OpenInvoice and store them in the customer's in-house document management system. This includes the original invoice (whether it was received via direct entry, or scanned/imported via Kofax Capture), and any attachments which might also have been uploaded by the supplier.

Invoice Connect currently supports the document management systems listed below. The modular nature of Invoice Connect means that adding additional document management systems is relatively straightforward.

- OpenText eDOCS
- PowerVision
- Microsoft SharePoint
- OpenText LiveLink / Content Server

Payment Status

Invoice Connect can also optionally be configured to transfer payment information back to OpenInvoice, thereby giving the supplier visibility in to when the invoice is actually paid (including cheque number, amount date etc) or voided.

Master Data

Fundamental to the operation of the OpenInvoice system is the availability of accurate and up-to-date master data, including AFEs and Cost Centres, against which invoices can be coded (either by the supplier, or by the user within OpenInvoice). Invoice Connect includes a set of schedulable utilities to extract the required data from the customer's Financial Accounting system (and also optionally other systems such as AFE Navigator) and make this available for upload to OpenInvoice. The synchronisation includes the ability to perform full uploads or incremental (delta) uploads.
